Art Unit: 2633

1. The following is a quotation of the appropriate paragraphs of 35 U.S.C. 102 that form the basis for the rejections under this section made in this Office action:

A person shall be entitled to a patent unless –

(e) the invention was described in (1) an application for patent, published under section 122(b), by another filed in the United States before the invention by the applicant for patent or (2) a patent granted on an application for patent by another filed in the United States before the invention by the applicant for patent, except that an international application filed under the treaty defined in section 351(a) shall have the effects for purposes of this subsection of an application filed in the United States only if the international application designated the United States and was published under Article 21(2) of such treaty in the English language.

2. Claims 1 and 4 are rejected under 35 U.S.C. 102(e) as being anticipated by Mendenhall et al (6,535,314). Mendenhall et al discloses a telescope (include in element 12), a scanning device (62), a beam splitter (66), and a acquisition sensor (98). (See Fig. 4)

3. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.

4. Claims 2 and 5 are rejected under 35 U.S.C. 103(a) as being unpatentable over Mendenhall et al (6,535,314). Fiber 65 transmitting more than one controlled signals; therefore, it would be obvious to connect fiber 65 to a diplexer. It is well known in the art to use feedback control for making acquisition easier. The feature "downstream of which a detector is connected via a second lightwave fiber" is a conventional feedback control; therefore, it does not distinguish over the prior art.

Art Unit: 2633

5. Claim 10 is rejected under 35 U.S.C. 103(a) as being unpatentable over Mendenhall et al. It is well known in the art to use CPA control and FPA control for providing inexpensive and accurate interfaces between the actuators.

6. Claims 3 and 6-9 are objected to as being dependent upon a rejected base claim, but would be allowable if rewritten in independent form including all of the limitations of the base claim and any intervening claims.
